

QUIZIO

Web-Based Quiz Platform

1. Introduction

Welcome to the Quizio project! This document is your complete guide to building Quizio - a web-based quiz platform developed in collaboration with Inova IT d.o.o. Read it carefully before you start coding. Everything you need to know - what to build, which technologies to use, and technical help is in here.

1.1 What is Quizio?

Quizio is an interactive web application with two types of users:

- Administrators - who create and manage quizzes
- Registered users - who browse and take those quizzes against the clock

The platform handles multiple-choice questions, including image comparison questions, configurable scoring per question, and a countdown timer that keeps ticking on the server - even if the user closes their browser tab.

1.2 What Are You Expected to Build?

You and your team will build Quizio from scratch - frontend, backend, database. By the end of the project you should have:

- A fully working web app
- Clean, well-structured code across the whole stack
- A live demo accessible via URL

2. Required Technology Stack

Frontend	Next.js App Router with Tailwind CSS for styling
Authentication	Firebase - for user login and registration
Backend	Go - REST API server for all core business logic
Database (SQL)	PostgreSQL

2.1 How the Pieces Fit Together

Here is a simple model of the architecture:

- Next.js frontend is what users see and interact with.
- [Next.js](#) frontend admin users see dashboard panel for managing quizzes.
- [Next.js](#) frontend users see available quizzes to start.
- When a user logs in, Firebase handles authentication.
- The Go backend processes the request, and reads/writes to PostgreSQL.

3. Functional Requirements

The tables below list everything your app must, should, and can optionally do. Each requirement has a priority level - make sure you understand what each one means before you start planning.

3.1 Admin Features

Requirement
Admin can create a new quiz with a title, description, and total time limit
Admin can add multiple-choice questions to a quiz
Admin can add image-based comparison questions (minimum two images per question)
Admin can assign a point value to each individual question
Admin can edit an existing quiz (title, time limit, questions, answers)
Admin can delete a quiz
Admin can publish or unpublish a quiz (controls whether users can see it)
Admin can view a list of all quizzes and their current publish status
Admin can view individual user results per quiz

3.2 User Features

Requirement
Users can register and log in using Firebase Authentication
Authenticated users can browse all currently published quizzes
Users can start a quiz from the quiz listing or quiz detail page
A visible countdown timer is shown throughout the entire quiz session
The countdown timer continues server-side even if the user closes their browser
When the timer expires, the quiz is automatically submitted with whatever answers were saved
Users can submit the quiz manually at any point before the timer runs out
Users can view a history of their past quiz attempts and scores

4. Design

We will share additional design screens later in the process to help refine and align on the proposed direction.
